

# nitamin™ COATED SAND

the last time sand made you this happy, it was at the beach

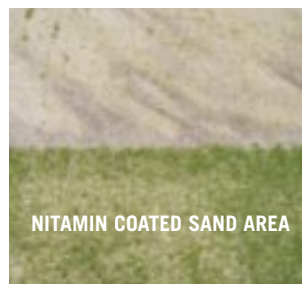

We're proud to introduce NITAMIN™ – an entirely new concept in nitrogen fertilizer technology. By ensuring a steady supply of nitrogen in the soil, NITAMIN STEADY-DELIVERY™ patented fertilizers essentially spoon-feed your turf, keeping it green and healthy throughout the season. Not only will your grass look green for extended periods of time, it will also grow at a consistent rate.

## the nitamin advantage

**NITAMIN Coated Sand is a unique, patent-pending way of delivering NITAMIN STEADY-DELIVERY nitrogen to your turf. NITAMIN Coated Sand has numerous advantages that make it perfectly suited for topdressing and new turf establishment with construction, renovation and divot repair.**

- Since the NITAMIN fertilizer is glued to the sand, it stays where it is put, even in more porous and sandy environments like golf greens.
- Fertilization and topdressing can be done at the same time. Because of NITAMIN's extended nitrogen release profile, you will not need to use NITAMIN Coated Sand every time you topdress. We recommend using NITAMIN Coated Sand for topdressing after aeration to encourage faster and denser turf recovery.
- The amount of NITAMIN on each grain of coated sand is small compared to the amount of nitrogen in each granule of granular fertilizers. Since the total amount of nitrogen applied with NITAMIN Coated Sand is divided over a larger number of particles, you can achieve better fertilizer coverage and a more even distribution than can be achieved with granular fertilizers. Your turf will maintain an even, green color and dense texture without a mottled appearance.
- The small particle size of sand allows NITAMIN to be distributed to the place where your grass needs it the most – the root zone – resulting in quick and dense turf growth or recovery. It also allows NITAMIN to be applied to greens without interfering with the quality of the playing surface.
- NITAMIN fertilizer technology is designed to have low levels of salt and biuret, minimizing risk of turf burn. NITAMIN is so safe that some formulations can even be applied directly to seeds and roots.

15 DAYS AFTER APPLICATION

5 MONTHS AFTER APPLICATION

We received quicker germination and it appeared much more of the seed germinated. Compared to the area that only had sand topdressing, the grass was at least twice as thick. It is still obvious where the treated area is after several months. **BILL WOMAC, CGCS, BIG CANOE GOLF CLUB**

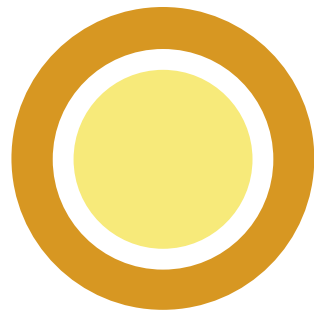

## where to find

NITAMIN Coated Sand is available in a variety of grades, including a USGA sand for use on greens and tees, and a less expensive sand for use in areas such as fairways, roughs, and driving ranges. A green-dyed NITAMIN Coated Sand is also available for divot repair. Please visit our website to learn more about NITAMIN STEADY-DELIVERY technology or for information on how to contact a sales rep near you.
